SUMMARY LANGUAGE: English

AB With an exponentially increasing body of scientific evidence pointing toward the potential of conotoxins for treatment of a wide variety of nervous system and associated neurological disorders, there has been an explosion of activity in this patent area with more than eighty new patents and PCT publications in the past five years. With the emergence of ziconotide (SNX-111, .omega.-conotoxin MVIIA) as the first clinically used conotoxin for treatment of a neurological disorder, the first part of the new millennium is likely to see many more new filings in this field. The majority of the applications from this period focus on those classes of conopeptides that interact with nicotinic acetylcholine receptors (nAChRs) together with those that block voltage-gated ion channels. This arena has

to date been dominated by three research groups: Neurex (a wholly-owned subsidiary of Elan, South San Francisco, CA, USA), Xenome and Institute for Molecular Bioscience (IMB), University of Queensland (Melbourne, Australia) and Cognetix (Salt Lake City, UT, USA) together with the University of Utah Research Foundation and the Salk Institute for Biological Studies (La Jolla, CA, USA).

AB Cone snails use venom containing a cocktail of peptides ('conopeptides')
to capture their prey. Many of these peptides also target mammalian
receptors, often with exquisite selectivity. Here we report the discovery
of two new classes of conopeptides. One class targets alpha1-adrenoceptors
(rho-TIA from the fish-hunting Conus tulipa), and the second class targets
the neuronal noradrenaline transporter (***chi*** - ***MrIA*** and
chi - ***MrIB*** from the mollusk-hunting C. marmoreus). rho-TIA
and ***chi*** - ***MrIA*** selectively modulate these important
membrane-bound proteins. Both peptides act as reversible non-competitive
inhibitors and provide alternative avenues for the identification of
inhibitor drugs.
